## 1. How to connect the wires:

PIN	COLOUR	FUNCTION
1	Blue	CAN L
2	White	CAN H
3	Black	Negative battery
4	Red	Vbatt. (12-24V)

Each end of the CAN bus is terminated with 120Ω resistors in compliance with the standard to minimize signal reflections on the bus. You may need to place a 120Ω resistor between CAN-L and CAN-H.

Warning: to avoid breakage do not tighten the backshell nuts with a torque exceeding 0.8 Nm!

## 2. Reference

### PKP3500SI

### 3. Message header description

The 29-bit CAN identifier used in J1939 is structured in the following way.

Priority	Reserved	Data Page	PDU Format	PDU Specific	Source Address
3 bits	1 bit	1 bit	8 bits	8 bits	8 bits

The proprietary format used by PKP keypads is defined as follows:

Priority = **6**.

Reserved = **0**.

Data page = **0**.

PDU Format = EFh (the message is addressable).

PDU Specific = Destination Address.

Parameter Group Number:

**61184** (EF00h) [PROPRIETARY A] used for configuration messages and LED command a (see page 6).

**42752** (A700h) [AUXILIARY I/O #2]

**42496** (A600h) [AUXILIARY I/O #3]

(See ISO 11783-3 for further details).

} Specifically used for LED command b (see page 7-8).

An example of CAN identifier of messages sent to the keypad is 18EF2100h where:

21h is the destination address (keypad)

00h is the source address.

An example of CAN identifier of messages sent by the keypad is 18EFFF21h where:

FFh refers to broadcast messages (no specific destination address)

21h is the source address (keypad).

### 4. General Data Format

The proprietary protocol has defined a general format for the data fields in the PGN 61184. The format consists of:

1 header field (2 bytes)

1 command byte

5 bytes (the remaining field) are defined specifically for each command.

The data length is 8 bytes, unused bits and bytes are set to all 1's (0xFF).

Byte 0	04h
Byte 1	1Bh
Byte 2	Command
Byte 3-7	Data required for each specific command

## b. Set multiple LED state

This command used as an alternative to the one described in the previous sub-chapter allows to manage more LED indicators at once. See the [command 37h](#) to enable it.

The LED state and color can be controlled by using either or both the CAN data frames (shown in the tables 1 and 2 below) depending on the light mode you want to set: the available functions are summarized in the table 3 at page 8.

The message to be sent to the keypad is structured so that each of four bit field within the 64 data bits controls a corresponding key-LED.

### Address claiming procedure:

Under normal operation, the keypad application sends an Address Claim parameter group at start up and waits up to 250ms for the other devices connected to the same network to send a message containing the device's address and name. The keypad checks every response and compares the names to see who has the highest priority. If a device is already using the address and has a higher priority, then a new address is selected, and the process starts over. If the keypad has a higher priority than the device in use then it waits for other systems to reply, while the responding device will have to change its address and send an address claim itself. If no message is received after the time (250ms) is up, then the device has claimed the address.

### Address claim parameter group:

Priority = 6.

Destination Address should always be the Global Address FFh

Parameter Group Number (PGN) = 60928(EE00h).

Data Length = 8

Data = NAME field
